### **Neurosurgery Second Opinion (short consultation)**

Patient: xxxxxxxxxxxx

DOB: 07/01/1931

DATE: 03/10/2022

#### **Discussion:**

I have reviewed the documents sent to me. They are the two radiology reports on the person of interest in this review and the questionnaire directed to the son.

The father, Antoine suffered a head injury when he was struck by a car. He was hospitalized. Serial CTs of the head reveal enlarged cerebral ventricles and small bilateral subdural hygromas with blood vs subdural hematoma. These findings evolved from 8/28/12, to 8/31/12, to 9/24/12. The injured father cleared and there was a follow-up CT of the head 2/18/13. This revealed clearing of the subdural pathology, but the ventricles are enlarged to a size larger than at the time of the first studies, suggesting hydrocephalus, most likely Normal-Pressure Hydrocephalus. No images were included for my review.

The son is concerned about the father's neurological deficits. These are loss of balance, tinnitus and decreased cognition. Questions concerning terms and medications. Innexium is for gastroesophageal reflux. Paracetamol is Tylenol, an NSAID for mild pain relief. Inogramme is French for serum electrolytes --Na<sup>+</sup>, K<sup>+</sup>, Cl<sup>-</sup>. The other drugs used in the Father's care are steroid drugs, something not usually used. Vit K was given to prevent further bleeding.

#### **Recommendations:**

1. MRI of the brain W/WO contrast.
2. Consult with neurologist for cognitive evaluation.
3. Consult with neurosurgeon to evaluate for Normal Pressure Hydrocephalus, which is my concerning diagnosis.

The above report was provided by the signing physician at the request of the referring physician, patient or patient representative as a second opinion. The opinions and recommendations included therein are provided on a strict advisory basis and are based on the images and clinical information provided. Neither the radiologist nor the company assume responsibility for any decisions made or actions taken based on this report nor for any effects that result from such decisions and actions. The responsibility for clinical decisions remains entirely upon the patient's medical team. This information has been clearly communicated at the time of request of this second opinion.
